

# DERMALENE BSF

DERMALENE BSF is a synthetic pre-tanning agent based on naphthalenic products for vegetable tanned leather.

## TYPICAL ANALYSIS

Appearance	Light brown powder
Solids	> 92 %
pH (10 % solution)	3.5 ± 0.5

## PROPERTIES

DERMALENE BSF has been developed for the non-astringent pre-tanning of every kind of vegetable leathers. It penetrates throughout the section of the hides, giving a light tanning which doesn't influence the final properties of the leather.

DERMALENE BSF helps the penetration of the vegetable tanning agents, avoiding their fixation at the surface. The grain is smooth and light coloured. Moreover, it can be applied in whatever process, drum, paddle etc.

In drum tanning, its pre-tanning and protective action enables the use of short floats, at lower pH values than the usual. This helps the absorption and the exhaustion of vegetable tanning agents. Its use reduces the risk of iron and copper spots, producing a smooth and flexible grain.

DERMALENE BSF has a small hash content, which gives vegetable leathers with low mineral substances content.

## APPLICATION

Recommended amounts range from 4 to 6 % based on pelt weight.

When correctly stored, it is stable 36 months.

This sheet is a synthetic illustration of the product to enable the user to employ it at the best.

Properties and values are not, therefore, sales specifications.

Taking into account the several possibilities of application of this product, no warranty of the results is possible.

**Expiry date refers to the product well closed in the original container, in fresh and dry area.** Some particularly sensitive products, when open, should be used rapidly.

**Stir well before using the product, close tightly the container to preserve the properties.**
